This procedure is divided in 4 simple steps.

Starting point

Figure 1 represents the box including the platform of talk2li$t®. This will be our starting point.

Step one

For the power supply please connect the black cable to the 24 VDC slot (-) and the red one to the 24 VDC slot (+) as it is showed in the picture above (Figure 2).

Step two

Connect the two cables to the Κ1 STOP1 that is on the left bottom site of the platform. Cables connect in parallel to the existing buttons in order to simulate the button presses.

The device provides 8 (or 16) solid state relays. If the elevator has more than 16 levels, then an expansion with up to 74 extra relays will be provided.

Step three

Please remove the SD card in order to configure the system with the user’s data.

Step four

Insert the SD card into the SD card reader and connect the card reader to your computer. A window will pop-up.

Please select the “Install” button.

Provide the necessary data to proceed.

Since you have completed this step simply remove the SD card reader and set the SD card into the talk2li$t® device. The device will be automatically updated with the information that the user has provided.

The system is now ready for use and is waiting for the voice commands.
